probability theory and in ergodic theory. In integration theory, specifying a measure allows one to define integrals on spaces more general than subsets of Euclidean space; moreover, the integral with respect to the Lebesgue measure on Euclidean spaces is more general and has a richer theory than its predecessor, the Riemann integral.

1.40, p.18-19). We construct a measure for an infinitely often repeated random experiment with finitely many possible outcomes (Product measure, Bernoulli measure). Let S be the set of possible outcomes. For s_2 , let $p_s > 0$ be the probability that occurs. Hence $\sum p_s = 1$. For a fixed realization of the repeated experiment, let $z = (z_1, z_2, \dots)$
